

# BACnet Test Suite

POWERFUL BACnet DEVICE VALIDATION AND DIAGNOSTICS

## TEST YOUR DEVICE IN DEVELOPMENT

Save time and money by detecting issues in your BACnet device during development.

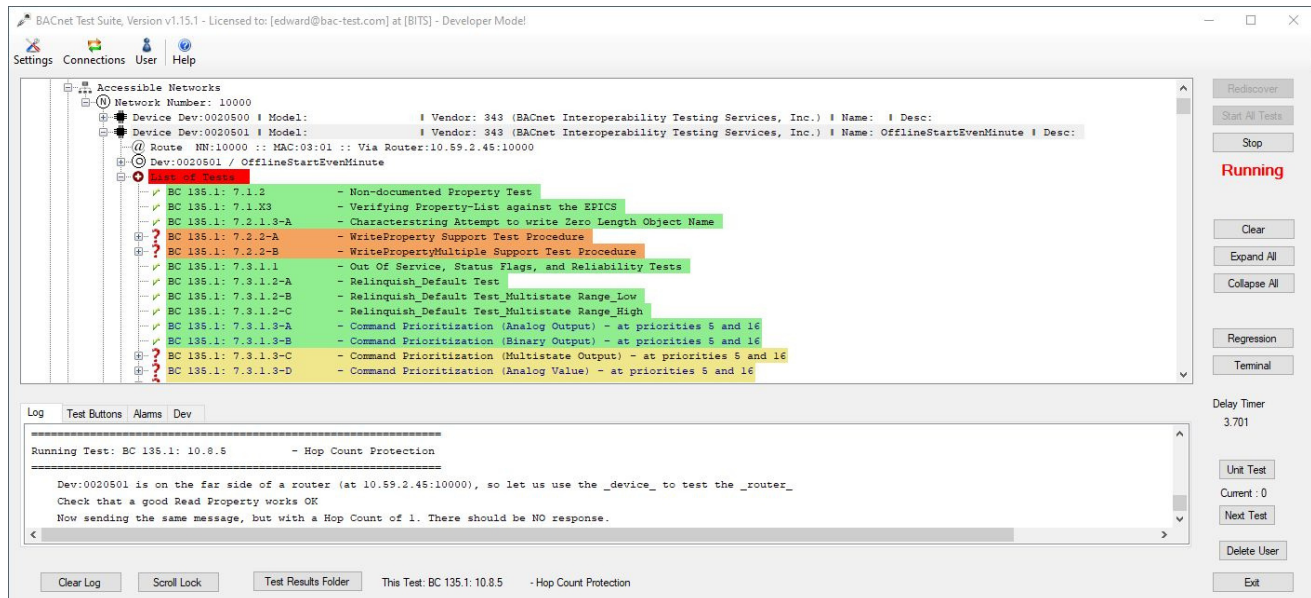

From stack validation to device configuration and communication, the BACnet Test Suite is a world-class tool to verify device performance.

Test your BACnet Device to reveal performance, conformance and interoperability issues before it is deployed in the field. The BITS BACnet Test Suite includes all BACnet objects and properties. It is designed to expose issues with your BACnet device/IUT (Implementation Under Test).

**Pre-test your device before submitting to BTL** to save time and money!

Designed for BACnet device developers, our Test Suite is built on best practices to expose most common failure modes, including those commonly seen in real world use cases.

## The BTS BACnet Test Suite for Devices

- Use our BACnet Test Suite during development for stress testing, regression testing, and testing after any software or hardware update. Uncover issues now – before the device or new version hits the market – when it is least expensive to address them.
- The Suite includes many tests that are not covered in the BTL process, but that have been found via experience to significantly impact field performance and provider reputations.
